

# Complete control - by your finger tip!

## AutoMaster 5000

Autronica offers a Unix or Linux based colour graphic indication, monitoring and control system - **a vital part of a fire safety management system.**

The complete GA plan is shown in one scrollable picture with very high resolution, eliminating the need for zooming. **AutoMaster 5000** gives a very short response time for any alarms, or updating status and new events. The system will monitor and indicate the situation for addressable detection devices, fire doors, sprinkler valves, low location lights etc.

Since the **AutoMaster 5000** system is approved by the maritime authorities, the system can replace the traditional LED "hardmimic" panel for fire detection, fire doors and sprinkler.

By means of the **AutoMaster 5000** system it is possible to:

- \* indicate fire spread and smoke concentration,
- \* indicate and control smoke and heat detectors,
- \* indicate the sprinkler system,
- \* indicate and control low location lights,
- \* indicate and control individual fire doors,
- \* indicate and control fire dampers,
- \* indicate fire extinguishers,
- \* indicate fire fighting equipment
- \* indicate high voltage lines.

The **AutoMaster 5000** will keep an individual "all event log" for all devices for 1 year.
